#### 7.2 Java reference

```
/* Java reference
                  References on Java IO, structures, etc.
*/
import java.io.*;
import java.lang.*;
import java.math.*;
import java.util.*;
/* Regular usage:
Slower IO
                  Slower IO:
    Scanner in = new Scanner (System.in);
    Scanner in = new Scanner (new BufferedInputStream (System.in));
                            in.nextInt () / in.nextBigInteger () / in.nextBigDecimal () / in.nextDouble ()
in.nextLine () / in.hasNext ()
Output :
                                      System.out.print (...);
System.out.println (...
                  System.out.printf (...);
Faster IO:
Shown below.
                  BigInteger :
                            BigInteger.valueOf (int) : convert to BigInteger.
                            consists of a BigInteger value and a scale.
The scale is the number of digits to the right of the decimal point.
                            divide (BigDecimal) : exact divide.
                            divide (BigDecimal, int scale, RoundingMode roundingMode):
    divide with roundingMode, which may be:
        CEILING / DOWN / FLOOR / HALF_DOWN / HALF_EVEN / HALF_UP / UNNECESSARY / UP.
BigDecimal setScale (int newScale, RoundingMode roundingMode):
    returns a BigDecimal with newScale.
doubleValue () / toPlainString (): converts to other types.
avs:
                  addfirst <E>:
  addLast (E) / getFirst / getLast / removeFirst / removeLast () :
        deque implementation.
  clear () / add (int, E) / remove (int) : clear, add & remove.
        size () / contains / removeFirstOccurrence / removeLastOccurrence (E) :
                 size () / contains / removeFirstOccurrence / removeLastOccurrence (E) :
    deque methods.
ListIterator <E> listIterator (int index) : returns an iterator :
    E next / previous () : accesses and iterates.
    hasNext / hasPrevious () : checks availablity.
    nextIndex / previousIndex () : returns the index of a subsequent call.
    add / set (E) / remove () : changes element.

PriorityQueue <E> (int initcap, Comparator <? super E> comparator) :
    add (E) / clear () / iterator () / peek () / poll () / size () :
        priority queue implementations.

TreeMap <K, V> (Comparator <? super K> comparator) :
    Map.Entry <K, V> ceilingEntry / floorEntry / higherEntry / lowerEntry (K):
        getKey / getValue () / setValue (V) : entries.
```

```
clear () / put (K, V) / get (K) / remove (K) : basic operation.
size () : size.
StringBuilder : .
                      Mutable string
                      Mutable string.

StringBuilder (string) : generates a builder.

append (int, string, ...) / insert (int offset, ...) : adds objects.

charAt (int) / setCharAt (int, char) : accesses a char.

delete (int, int) : removes a substring.

reverse () : reverses itself.

length () : returns the length.
                       toString () : converts to string.
              String:
Immutable string.
String.format (String, ...): formats a string. i.e. sprintf.
toLowerCase / toUpperCase (): changes the case of letters.
/* Examples on Comparator :
public class Main {
       public static class Point {
               public int x;
public int y;
public Point () {

\begin{array}{l}
\mathbf{x} = 0; \\
\mathbf{y} = 0;
\end{array}

               public Point (int xx, int yy) {
    x = xx;
    y = yy;
        };
      public static class Cmp implements Comparator <Point> {
   public int compare (Point a, Point b) {
     if (a.x < b.x) return -1;
     if (a.x = b.x) {
        if (a.y < b.y) return -1;
        if (a.y == b.y) return 0;
}</pre>
                       return 1;
               }
       public static void main (String [] args) {
               Cmp c = new Cmp ();
TreeMap <Point, Point> t = new TreeMap <Point, Point> (c);
               return:
1;
       Another way to implement is to use Comparable. However, equalTo and hashCode must be rewritten.
        Otherwise, containers may fail.
        Example :
       public static class Point implements Comparable <Point> {
              public int x;
public int y;
               public Point () {
    x = 0;
    y = 0;
               public Point (int xx, int yy) {
    x = xx;
    y = yy;
              public int compareTo (Point p) {
    if (x < p.x) return -1;
    if (x == p.x) {
        if (y < p.y) return -1;
        if (y == p.y) return 0;
}</pre>
                       return 1;
               public boolean equalTo (Point p) {
    return (x == p.x && y == p.y);
               public int hashCode () {
    return x + y;
       1;
//Faster IO :
public class Main {
       static class InputReader {
              public BufferedReader reader;
public StringTokenizer tokenizer;
public InputReader (InputStream stream) {
    reader = new BufferedReader (new InputStreamReader (stream), 32768);
    tokenizer = null;
               public String next() {
    while (tokenizer == null || !tokenizer.hasMoreTokens()) {
                                     String line = reader.readLine();
tokenizer = new StringTokenizer (line);
                              } catch (IOException e) {
   throw new RuntimeException (e);
                       return tokenizer.nextToken();
               public BigInteger nextBigInteger() {
                      return new BigInteger (next (), 10);
                                                                                                 // customize the radix here.
               public int nextInt() {
    return Integer.parseInt (next());
```

```
}
public double nextDouble() {
    return Double.parseDouble (next());
}

public static void main (String[] args) {
    InputReader in = new InputReader (System.in);
    // Put your code here.
}
```

#### 7.4.4.2 G++

#### 7.5 Math reference

#### 7.5.1 Catalan number

For

$$\begin{split} f(0) &= 1 \\ f(1) &= 1 \\ f(n) &= f(n-1)f(0) + f(n-2)f(1) + \ldots + f(1)f(n-2) + f(0)f(n-1) \end{split}$$

We have  $f(n) = \frac{(2n)!}{n!(n+1)!}$ .

#### 7.5.2Dynamic programming optimization

#### 7.5.2.1Convex hull optimization

Generally, in dynamic programming with recurrence

$$f(i) = \min_{k < i} \{a[i]b(j) + c(j)\}$$

all decisions k can be treated as a set of segments on a convex hull. By applying Graham's scanning, it is possible to maintain such hull in a monotone queue or a std::tuple <slope, intercept, x\_min>. Hence, k(i) can be obtained by performing a binary search in the hull.

#### 7.5.2.2 Divide & conquer optimization

For recurrence

$$f(i) = \min_{k < i} \{b(k) + c[k][i]\}$$

 $k(i) \le k(i+1)$  holds true if c[a][c] + c[b][d] < c[a][d] + c[b][c]. Thus, k(i) can be maintained in a monotone queue.

#### 7.5.2.3 Knuth optimization

For recurrence

$$f(i,j) = \min_{i < k < j} \{ f(i,k) + f(k,j) \} + c[i][j]$$

 $k(i, j - 1) \le k(i, j) \le k(i + 1, j)$  holds true if c[a][c] + c[b][d] < c[a][d] + c[b][c].

#### 7.5.3 Integration table

### 7.5.3.1 $ax^2 + bx + c(a > 0)$

1. 
$$\int \frac{\mathrm{d}x}{ax^2 + bx + c} = \begin{cases} \frac{2}{\sqrt{4ac - b^2}} \arctan \frac{2ax + b}{\sqrt{4ac - b^2}} + C & (b^2 < 4ac) \\ \frac{1}{\sqrt{b^2 - 4ac}} \ln \left| \frac{2ax + b - \sqrt{b^2 - 4ac}}{2ax + b + \sqrt{b^2 - 4ac}} \right| + C & (b^2 > 4ac) \end{cases}$$

2. 
$$\int \frac{x}{ax^2+bx+c} dx = \frac{1}{2a} \ln |ax^2+bx+c| - \frac{b}{2a} \int \frac{dx}{ax^2+bx+c}$$

## **7.5.3.2** $\sqrt{\pm ax^2 + bx + c}(a > 0)$

1. 
$$\int \frac{dx}{\sqrt{ax^2 + bx + c}} = \frac{1}{\sqrt{a}} \ln|2ax + b + 2\sqrt{a}\sqrt{ax^2 + bx + c}| + C$$

2. 
$$\int \sqrt{ax^2 + bx + c} dx = \frac{2ax + b}{4a} \sqrt{ax^2 + bx + c} + \frac{4ac - b^2}{8\sqrt{a^3}} \ln|2ax + b + 2\sqrt{a}\sqrt{ax^2 + bx + c}| + C$$

3. 
$$\int \frac{x}{\sqrt{ax^2 + bx + c}} dx = \frac{1}{a} \sqrt{ax^2 + bx + c} - \frac{b}{2\sqrt{a^3}} \ln|2ax + b + 2\sqrt{a}\sqrt{ax^2 + bx + c}| + C$$

4. 
$$\int \frac{\mathrm{d}x}{\sqrt{c+bx-ax^2}} = -\frac{1}{\sqrt{a}} \arcsin \frac{2ax-b}{\sqrt{b^2+4ac}} + C$$

5. 
$$\int \sqrt{c + bx - ax^2} dx = \frac{2ax - b}{4a} \sqrt{c + bx - ax^2} + \frac{b^2 + 4ac}{8\sqrt{a^3}} \arcsin \frac{2ax - b}{\sqrt{b^2 + 4ac}} + C$$

6. 
$$\int \frac{x}{\sqrt{c+bx-ax^2}} dx = -\frac{1}{a}\sqrt{c+bx-ax^2} + \frac{b}{2\sqrt{a^3}} \arcsin \frac{2ax-b}{\sqrt{b^2+4ac}} + C$$

# **7.5.3.3** $\sqrt{\pm \frac{x-a}{x-b}}$ and $\sqrt{(x-a)(x-b)}$

1. 
$$\int \frac{\mathrm{d}x}{\sqrt{(x-a)(b-x)}} = 2\arcsin\sqrt{\frac{x-a}{b-x}} + C \ (a < b)$$

2. 
$$\int \sqrt{(x-a)(b-x)} \mathrm{d}x = \frac{2x-a-b}{4} \sqrt{(x-a)(b-x)} + \frac{(b-a)^2}{4} \arcsin \sqrt{\frac{x-a}{b-x}} + C \ (a < b)$$

#### 7.5.3.4 Integration of trigonometric functions

1. 
$$\int \tan x dx = -\ln|\cos x| + C$$

2. 
$$\int \cot x dx = \ln|\sin x| + C$$

3. 
$$\int \sec x dx = \ln \left| \tan \left( \frac{\pi}{4} + \frac{x}{2} \right) \right| + C = \ln \left| \sec x + \tan x \right| + C$$

4. 
$$\int \csc x dx = \ln \left| \tan \frac{x}{2} \right| + C = \ln \left| \csc x - \cot x \right| + C$$

$$5. \int \sec^2 x dx = \tan x + C$$

$$6. \int \csc^2 x dx = -\cot x + C$$

7. 
$$\int \sec x \tan x dx = \sec x + C$$

8. 
$$\int \csc x \cot x dx = -\csc x + C$$

9. 
$$\int \sin^2 x dx = \frac{x}{2} - \frac{1}{4} \sin 2x + C$$

10. 
$$\int \cos^2 x dx = \frac{x}{2} + \frac{1}{4} \sin 2x + C$$

11. 
$$\int \sin^n x dx = -\frac{1}{n} \sin^{n-1} x \cos x + \frac{n-1}{n} \int \sin^{n-2} x dx$$

12. 
$$\int \cos^n x dx = \frac{1}{n} \cos^{n-1} x \sin x + \frac{n-1}{n} \int \cos^{n-2} x dx$$

13. 
$$\int \frac{dx}{\sin^n x} = -\frac{1}{n-1} \frac{\cos x}{\sin^{n-1} x} + \frac{n-2}{n-1} \int \frac{dx}{\sin^{n-2} x}$$

14. 
$$\int \frac{dx}{\cos^n x} = \frac{1}{n-1} \frac{\sin x}{\cos^{n-1} x} + \frac{n-2}{n-1} \int \frac{dx}{\cos^{n-2} x}$$

15. 
$$\int \cos^m x \sin^n x dx$$

$$\int \cos^{n} x \sin^{n} x dx$$

$$= \frac{1}{m+n} \cos^{m-1} x \sin^{n+1} x + \frac{m-1}{m+n} \int \cos^{m-2} x \sin^{n} x dx$$

$$= -\frac{1}{m+n} \cos^{m+1} x \sin^{n-1} x + \frac{n-1}{m+1} \int \cos^{m} x \sin^{n-2} x dx$$

16. 
$$\int \frac{\mathrm{d}x}{a+b\sin x} = \begin{cases} \frac{2}{\sqrt{a^2 - b^2}} \arctan \frac{a\tan \frac{x}{2} + b}{\sqrt{a^2 - b^2}} + C & (a^2 > b^2) \\ \frac{1}{\sqrt{b^2 - a^2}} \ln \left| \frac{a\tan \frac{x}{2} + b - \sqrt{b^2 - a^2}}{a\tan \frac{x}{2} + b + \sqrt{b^2 - a^2}} \right| + C & (a^2 < b^2) \end{cases}$$

17. 
$$\int \frac{\mathrm{d}x}{a+b\cos x} = \begin{cases} \frac{2}{a+b} \sqrt{\frac{a+b}{a-b}} \arctan\left(\sqrt{\frac{a-b}{a+b}} \tan\frac{x}{2}\right) + C & (a^2 > b^2) \\ \frac{1}{a+b} \sqrt{\frac{a+b}{a-b}} \ln\left|\frac{\tan\frac{x}{2} + \sqrt{\frac{a+b}{b-a}}}{\tan\frac{x}{2} - \sqrt{\frac{a+b}{b-a}}}\right| + C & (a^2 < b^2) \end{cases}$$

18. 
$$\int \frac{\mathrm{d}x}{a^2 \cos^2 x + b^2 \sin^2 x} = \frac{1}{ab} \arctan\left(\frac{b}{a} \tan x\right) + C$$

19. 
$$\int \frac{dx}{a^2 \cos^2 x - b^2 \sin^2 x} = \frac{1}{2ab} \ln \left| \frac{b \tan x + a}{b \tan x - a} \right| + C$$

20. 
$$\int x \sin ax dx = \frac{1}{a^2} \sin ax - \frac{1}{a} x \cos ax + C$$

21. 
$$\int x^2 \sin ax dx = -\frac{1}{a}x^2 \cos ax + \frac{2}{a^2}x \sin ax + \frac{2}{a^3}\cos ax + C$$

22. 
$$\int x \cos ax dx = \frac{1}{a^2} \cos ax + \frac{1}{a} x \sin ax + C$$

23. 
$$\int x^2 \cos ax dx = \frac{1}{a}x^2 \sin ax + \frac{2}{a^2}x \cos ax - \frac{2}{a^3}\sin ax + C$$

### 7.5.3.5 Integration of inverse trigonometric functions (a > 0)

1. 
$$\int \arcsin \frac{x}{a} dx = x \arcsin \frac{x}{a} + \sqrt{a^2 - x^2} + C$$

2. 
$$\int x \arcsin \frac{x}{2} dx = (\frac{x^2}{2} - \frac{a^2}{4}) \arcsin \frac{x}{2} + \frac{x}{4} \sqrt{x^2 - x^2} + C$$

3. 
$$\int x^2 \arcsin \frac{x}{a} dx = \frac{x^3}{3} \arcsin \frac{x}{a} + \frac{1}{9}(x^2 + 2a^2)\sqrt{a^2 - x^2} + C$$

4. 
$$\int \arccos \frac{x}{a} dx = x \ \arccos \frac{x}{a} - \sqrt{a^2 - x^2} + C$$

5. 
$$\int x \arccos \frac{x}{a} dx = (\frac{x^2}{2} - \frac{a^2}{4}) \arccos \frac{x}{a} - \frac{x}{4} \sqrt{a^2 - x^2} + C$$

6. 
$$\int x^2 \arccos \frac{x}{a} dx = \frac{x^3}{3} \arccos \frac{x}{a} - \frac{1}{9}(x^2 + 2a^2)\sqrt{a^2 - x^2} + C$$

7. 
$$\int \arctan \frac{x}{a} dx = x \arctan \frac{x}{a} - \frac{a}{2} \ln(a^2 + x^2) + C$$

8. 
$$\int x \arctan \frac{x}{a} dx = \frac{1}{2} (a^2 + x^2) \arctan \frac{x}{a} - \frac{a}{2} x + C$$

9. 
$$\int x^2 \arctan \frac{x}{a} dx = \frac{x^3}{3} \arctan \frac{x}{a} - \frac{a}{6}x^2 + \frac{a^3}{6} \ln (a^2 + x^2) + C$$

#### 7.5.3.6 Integration of exponential functions

$$1. \int a^x dx = \frac{1}{\ln a} a^x + C$$

$$2. \int e^{ax} dx = \frac{1}{a} a^{ax} + C$$

3. 
$$\int xe^{ax} dx = \frac{1}{a^2}(ax-1)a^{ax} + C$$

4. 
$$\int x^n e^{ax} dx = \frac{1}{a} x^n e^{ax} - \frac{n}{a} \int x^{n-1} e^{ax} dx$$

5. 
$$\int x a^x dx = \frac{x}{\ln a} a^x - \frac{1}{(\ln a)^2} a^x + C$$

6. 
$$\int x^n a^x dx = \frac{1}{\ln a} x^n a^x - \frac{n}{\ln a} \int x^{n-1} a^x dx$$

7. 
$$\int e^{ax} \sin bx dx = \frac{1}{a^2 + b^2} e^{ax} (a \sin bx - b \cos bx) + C$$

8. 
$$\int e^{ax} \cos bx dx = \frac{1}{a^2 + b^2} e^{ax} (b \sin bx + a \cos bx) + C$$

9. 
$$\int e^{ax} \sin^n bx dx = \frac{1}{a^2 + b^2 n^2} e^{ax} \sin^{n-1} bx (a \sin bx - nb \cos bx) + \frac{n(n-1)b^2}{a^2 + b^2 n^2} \int e^{ax} \sin^{n-2} bx dx$$

10. 
$$\int e^{ax} \cos^n bx dx = \frac{1}{a^2 + b^2 n^2} e^{ax} \cos^{n-1} bx (a \cos bx + nb \sin bx) + \frac{n(n-1)b^2}{a^2 + b^2 n^2} \int e^{ax} \cos^{n-2} bx dx$$

### 7.5.3.7 Integration of logistic functions

1. 
$$\int \ln x dx = x \ln x - x + C$$

2. 
$$\int \frac{\mathrm{d}x}{x \ln x} = \ln \left| \ln x \right| + C$$

3. 
$$\int x^n \ln x dx = \frac{1}{n+1} x^{n+1} (\ln x - \frac{1}{n+1}) + C$$

4. 
$$\int (\ln x)^n dx = x(\ln x)^n - n \int (\ln x)^{n-1} dx$$

5. 
$$\int x^m (\ln x)^n dx = \frac{1}{m+1} x^{m+1} (\ln x)^n - \frac{n}{m+1} \int x^m (\ln x)^{n-1} dx$$

#### Prefix sum of multiplicative functions

Define the Dirichlet convolution f \* g(n) as:

$$f * g(n) = \sum_{d=1}^{n} [d|n]f(n)g(\frac{n}{d})$$

Assume we are going to calculate some function  $S(n) = \sum_{i=1}^{n} f(i)$ , where f(n) is a multiplicative function. Say we find some g(n) that is simple to calculate, and  $\sum_{i=1}^{n} f * g(i)$  can be figured out in O(1) complexity. Then we have

$$\begin{split} \sum_{i=1}^n f * g(i) &= \sum_{i=1}^n \sum_d [d|i] g(\frac{i}{d}) f(d) \\ &= \sum_{\frac{i}{d}=1}^n \sum_{d=1}^{\left\lfloor \frac{n}{\frac{i}{d}} \right\rfloor} g(\frac{i}{d}) f(d) \\ &= \sum_{i=1}^n \sum_{d=1}^{\left\lfloor \frac{n}{i} \right\rfloor} g(i) f(d) \\ &= g(1) S(n) + \sum_{i=2}^n g(i) S(\left\lfloor \frac{n}{i} \right\rfloor) \\ S(n) &= \frac{\sum_{i=1}^n f * g(i) - \sum_{i=2}^n g(i) S(\left\lfloor \frac{n}{i} \right\rfloor)}{g(1)} \end{split}$$

It can be proven that  $\lfloor \frac{n}{i} \rfloor$  has at most  $O(\sqrt{n})$  possible values. Therefore, the calculation of S(n) can be reduced to  $O(\sqrt{n})$ calculations of  $S(\lfloor \frac{n}{i} \rfloor)$ . By applying the master theorem, it can be shown that the complexity of such method is  $O(n^{\frac{3}{4}})$ .

Moreover, since f(n) is multiplicative, we can process the first  $n^{\frac{2}{3}}$  elements via linear sieve, and for the rest of the elements, we apply the method shown above. The complexity can thus be enhaced to  $O(n^{\frac{2}{3}})$ .

For the prefix sum of Euler's function  $S(n) = \sum_{i=1}^{n} \varphi(i)$ , notice that  $\sum_{d|n} \varphi(d) = n$ . Hence  $\varphi * I(n) = id(n).(I(n)) = id(n)$ 1, id(n) = n) Now let g(n) = I(n), and we have  $S(n) = \sum_{i=1}^{n} i - \sum_{i=2}^{n} S(\lfloor \frac{n}{i} \rfloor)$ . For the prefix sum of Mobius function  $S(n) = \sum_{i=1}^{n} \mu(i)$ , notice that  $\mu * I(n) = [n = 1]$ . Hence  $S(n) = 1 - \sum_{i=2}^{n} S(\lfloor \frac{n}{i} \rfloor)$ .

#### 7.5.5 Prufer sequence

In combinatorial mathematics, the Prufer sequence of a labeled tree is a unique sequence associated with the tree. The sequence for a tree on n vertices has length n-2.

One can generate a labeled tree's Prufer sequence by iteratively removing vertices from the tree until only two vertices remain. Specifically, consider a labeled tree T with vertices 1, 2, ..., n. At step i, remove the leaf with the smallest label and set the ith element of the Prufer sequence to be the label of this leaf's neighbour.

One can generate a labeled tree from a sequence in three steps. The tree will have n+2 nodes, numbered from 1 to n+2. For each node set its degree to the number of times it appears in the sequence plus 1. Next, for each number in the sequence a[i], find the first (lowest-numbered) node, j, with degree equal to 1, add the edge (j, a[i]) to the tree, and decrement the degrees of j and a[i]. At the end of this loop two nodes with degree 1 will remain (call them u, v). Lastly, add the edge (u,v) to the tree.

The Prufer sequence of a labeled tree on n vertices is a unique sequence of length n-2 on the labels 1 to n - this much is clear. Somewhat less obvious is the fact that for a given sequence S of length n-2 on the labels 1 to n, there is a unique labeled tree whose Prufer sequence is S.

#### 7.5.6 Spanning tree counting

**Kirchhoff's Theorem:** the number of spanning trees in a graph G is equal to any cofactor of the Laplacian matrix of G, which is equal to the difference between the graph's degree matrix (a diagonal matrix with vertex degrees on the diagonals) and its adjacency matrix (a (0,1)-matrix with 1's at places corresponding to entries where the vertices are adjacent and 0's otherwise).

The number of edges with a certain weight in a minimum spanning tree is fixed given a graph. Moreover, the number of its arrangements can be obtained by finding a minimum spannig tree, compressing connected components of other edges in that tree into a point, and then applying Kirrchoff's theorem with only edges of the certain weight in the graph. Therefore, the number of minimum spanning trees in a graph can be solved by multiplying all numbers of arrangements of edges of different weight together.

# 7.6 Regular expression

```
/* C++11 supports regular expressions, see below for an example. */
char str[] = "The_thirty-three_thieves_thought_that_they_thrilled_the_throne_throughout_Thursday.";
std::regex_pattern ("(th|Th)[\\w]*", std::regex_constants::optimize | std::regex_constants::ECMAScript);
std::match_results <char *> match;
std::regex_constants::match_flag_type flag = std::regex_constants::match_default;
int begin = 0, end = strlen (str);
while (std::regex_search (str + begin, str + end, match, pattern, flag)) {
    std::cout << match[0] << "_" << match[1] << std::endl;
    begin += match.position (0) + 1;
    flag |= std::regex_constants::match_prev_avail;
}</pre>
```

### 7.6.1 Special pattern characters

Characters	Description	Matches	
	. Not newline Any character except line terminators (LF, CR, LS		
\t Tab (HT) A horizontal tab character (same as \u		A horizontal tab character (same as \u0009).	
		A newline (line feed) character (same as \u000A).	
\v	Vertical tab (VT)	A vertical tab character (same as \u000B).	
\f	Form feed (FF)	A form feed character (same as \u000C).	
\r	Carriage return (CR)	A carriage return character (same as \u0000D).	
\cletter	Control code	A control code character whose code unit value is the same as the remainder of dividing the code unit value of letter by 32. For example: \ca is the same as \u00001, \cb the same as \u00002, and so on	
\xhh	ASCII character	A character whose code unit value has an hex value equivalent to the two hex digits hh. For example: \x4c is the same as L, or \x23 the same as #.	
\uhhhh       Unicode character       A character whose code unit value has an hex value equival digits hhhh.         \( \) \\( \) \( \)		A character whose code unit value has an hex value equivalent to the four hex digits hhhh.	
		A null character (same as \u0000).	
		The result of the submatch whose opening parenthesis is the int-th (int shall begin by a digit other than 0). See groups below for more info.	
		A decimal digit character (same as [[:digit:]]).	
		Any character that is not a decimal digit character (same as [^[:digit:]]).	
\s	Whitespace	A whitespace character (same as [[:space:]]).	
\S	Not whitespace	Any character that is not a whitespace character (same as [^[:space:]]).	
		An alphanumeric or underscore character (same as [_[:alnum:]]).	
\W	Not word	Any character that is not an alphanumeric or underscore character (same as [^_[:alnum:]]).	
\character Character Character Character as it is, without interpretable within a regex expression. Any character can be a form any of the special character sequences.		The character character as it is, without interpreting its special meaning within a regex expression. Any character can be escaped except those which form any of the special character sequences above. Needed for:  ^ \$ \ . * + ? ( ) [ ] { }  .	
[class]	Character class	The target character is part of the class (see character classes below).	
[^class]	Negated character class	The target character is not part of the class (see character classes below).	

### 7.6.2 Quantifiers

Characters	Times	Effects	
*	0 or more	The preceding atom is matched 0 or more times.	
+	1 or more	The preceding atom is matched 1 or more times.	
?	0 or 1	The preceding atom is optional (matched either 0 times or once).	
{int}	int	The preceding atom is matched exactly int times.	
{int,}	int or more	The preceding atom is matched int or more times.	
{min, max}	Between min and	The preceding atom is matched at least min times, but not more than max.	
(milli, max)	max		

By default, all these quantifiers are greedy (i.e., they take as many characters that meet the condition as possible). This behavior can be overridden to ungreedy (i.e., take as few characters that meet the condition as possible) by adding a question mark (?) after the quantifier.

### **7.6.3** Groups

Characters	Description	Effects	
(subpattern) Group		Creates a backreference.	
(?:subpattern) Passive group		Does not create a backreference.	

### 7.6.4 Assertions

Characters	Description	Condition for match	
^	Beginning of line Either it is the beginning of the target see terminator.		
\$	End of line	Either it is the end of the target sequence, or precedes a line terminator.	
\b	Word boundary	The previous character is a word character and the next is a non-word character (or vice-versa). Note: The beginning and the end of the target sequence are considered here as non-word characters.	
\B	Not a word boundary	The previous and next characters are both word characters or both are non-word characters. Note: The beginning and the end of the target sequence are considered here as non-word characters.	
(?=subpattern)	Positive lookahead	The characters following the assertion must match subpattern, but no characters are consumed.	
(?!subpattern)	Negative lookahead	The characters following the assertion must not match subpattern, but no characters are consumed.	

#### 7.6.5 Alternative

A regular expression can contain multiple alternative patterns simply by separating them with the separator operator (+): The regular expression will match if any of the alternatives match, and as soon as one does.

#### 7.6.6 Character classes

Class	Description	Equivalent (with regex_traits, default locale)
[:alnum:]	Alpha-numerical character	isalnum
[:alpha:]	Alphabetic character	isalpha
[:blank:]	Blank character	isblank
[:cntrl:]	Control character	iscntrl
[:digit:]	Decimal digit character	isdigit
[:graph:]	Character with graphical representation	isgraph
[:lower:]	Lowercase letter	islower
[:print:]	Printable character	isprint
[:punct:]	Punctuation mark character	ispunct
[:space:]	Whitespace character	isspace
[:upper:]	Uppercase letter	isupper
[:xdigit:]	Hexadecimal digit character	isxdigit
[:d:]	Decimal digit character	isdigit
[:w:]	Word character	isalnum
[:s:]	Whitespace character	isspace

Please note that the brackets in the class names are additional to those opening and closing the class definition. For example: [[:alpha:]] is a character class that matches any alphabetic character.

[abc[:digit:]] is a character class that matches a, b, c, or a digit.

[^[:space:]] is a character class that matches any character except a whitespace.
